

Enchain-Track: Project Evaluation & Completion Report

This report evaluates the current implementation status of features in the Enchain-Track system and documents recommendations for achieving 100% completion.

Presentation of Initial Output

System Feature	Status	Recommendations/Suggestion	Percentage of Completion
User Authentication & Session Management	Signup/login functional for customers and employees. Redirects successfully based on database roles.	Secure admin dashboard URLs from client-side direct access. Ensure full local storage clearance on logout.	85%
Date Formatting System	Orders list displays static mock date (2026-05-23) due to hardcoded format helper in global.js.	Modify the formatDate helper to dynamically parse and return actual transaction timestamps.	50%
Retail Product Management	Full CRUD functions integrated with database. Discount percentages and details update successfully.	Implement local image file uploads and storage instead of relying entirely on external image URLs.	90%
Inventory & Raw Materials	Raw goods tracking is functional with supplier connections and full CRUD capabilities.	Connect raw inventory items to retail products to auto-deduct raw materials when orders are processed.	85%
Checkout & Payment Processing	COD and GCash payment reference capture integrated with checkout forms and order database.	Integrate sandbox payment gateway verification or establish a manual admin verification queue.	90%
Sales & Order Tracking	Admin sales logs and dashboard overview show totals, revenues, active customers, and stock alerts.	Provide sales reporting tools such as spreadsheet exporting (CSV) for accounting.	90%

Presentation of completion

Recommendations/Suggestion	Status and Actions Done	Percentage of completion
Secure admin dashboard URLs from client-side direct access. Ensure full local storage clearance on logout.	Implemented client-side route guards in global.js to redirect unauthorized guest or customer roles. Added 'role' key storage clearance on user logout.	100%
Modify the formatDate helper to dynamically parse and return actual transaction timestamps.	Refactored the formatDate function in global.js to parse the actual database order_date parameter dynamically.	100%
Implement local image file uploads and storage instead of relying entirely on external image URLs.	Added an image file input component, server-side asset directory saving, and database image path synchronization.	100%
Connect raw inventory items to retail products to auto-deduct raw materials when orders are processed.	Created database triggers and mapping tables linking finished products to raw goods, enabling automatic stock deduction.	100%
Integrate sandbox payment gateway verification or establish a manual admin verification queue.	Created an admin transaction approval panel to verify submitted GCash reference codes before transitioning orders.	100%
Provide sales reporting tools such as spreadsheet exporting (CSV) for accounting.	Added a 'Download CSV' utility to the admin sales table to export transaction records directly.	100%
